Mathematics Crosswalk Common Core State Standards to Connecticut State Standards

Grades 9-12

Mathematics Standards for High School

The high school standards specify the mathematics that all students should study in order to be college and career ready. Additional mathematics that students should learn in order to take advanced courses such as calculus, advanced statistics, or discrete mathematics is indicated by (+), as in this example:

(+) Represent complex numbers on the complex plane in rectangular and polar form (including real and imaginary numbers).

All standards without a (+) symbol should be in the common mathematics curriculum for all college and career ready students. Standards without a (+) symbol may also appear in courses intended for all students. The high school standards are listed in conceptual categories:

- Number and Quantity
- Algebra
- Functions
- Modeling
- Geometry
- Statistics and Probability

Conceptual categories portray a coherent view of high school mathematics; a student's work with functions, for example, crosses a number of traditional course boundaries, potentially up through and including calculus.

Modeling is best interpreted not as a collection of isolated topics but in relation to other standards. Making mathematical models is a *Standard for Mathematical Practice*, and specific modeling standards appear throughout the high school standards indicated by an asterisk (*). The asterisk sometimes appears on the heading for a group of standards; in that case, it should be understood to apply to all standards in that group.

Content for the Grades 9-12 Connecticut standards is addressed through a grade band divided into 9-12 Core (C) and 9-12 Extended (E). The 9-12 Core specifies the expectations that could potentially be tested on CAPT as well as those concepts and skills **all** students should know and be able to do prior to high school graduation. Content for Grades 9-12 Extended represents concepts that students could encounter in a variety of typical high school courses beginning with Algebra II and beyond.

Functions				
Interpreting Functions				
Understand the concept of a function and use function notation				
CCSS	CT Standard Match	District Correlation	CT Assessment	
CC.9-12.F.IF.1 Understand that a function from one set (called the domain) to another set (called the range) assigns to each element of the domain exactly one element of the range. If f is a function and x is an element of its domain, then $f(x)$ denotes the output of f corresponding to the input x. The graph of f is the graph of the	CT.9-12.1.C.1.a.(3) Identify the characteristics of functions and relations, including domain and range.		CT.9-12.1.C.1.a.(3) Identify the characteristics of functions and relations, including domain and range.	
equation $y = f(x)$. CC.9-12.F.IF.2 Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.	CT.9-12.1.C.1.a.(3) Identify the characteristics of functions and relations, including domain and range.		CT.9-12.1.C.1.a.(3) Identify the characteristics of functions and relations, including domain and range.	
CC.9-12.F.IF.3 Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers. For example, the Fibonacci sequence is defined recursively by $f(0) = f(1) = 1$, $f(n+1) = f(n) + f(n-1)$ for $n \ge 1$ (n is greater than or equal to 1).	CT.9-12.1.C.1.a.(1) Identify, describe, create and generalize numeric, geometric and statistical patterns with tables, graphs, words and symbolic rules. CT.9-12.1.E.1.a.(7) Apply the concepts of limits to sequences and asymptotic behavior of functions.		CT.9-12.1.C.1.a.(1) Identify, describe, create and generalize numeric, geometric and statistical patterns with tables, graphs, words and symbolic rules.
